

CALL WAITING CALLING PARTY DEFINED CONTENT

ABSTRACT

5 Embodiments of the method and system provide for providing a call waiting method for use in a telecommunications network in which a first caller is engaged in a current call with a second caller, and for processing an incoming call from a third caller to the first caller. The method may have the steps of: providing identification of a plurality of callers in a predefined caller group; detecting an incoming call from
10 a third caller to a first caller, the first caller presently being engaged in a current call with a second caller; checking if the third caller is a member of the predefined caller group; if the third caller is a member of the predefined caller group, signaling the third caller to leave a message to be sent to the first caller with a call waiting indication, recording a message from the third caller, and providing to the first caller
15 a call waiting indication along with the recorder message from the third caller; and, if the third caller is not a member of the predefined caller group, providing to the first caller only a call waiting indication. The system implements the method.
